

docuteam bridge v1.0

Goal

Clients – mostly client applications, but also individuals – should be able to submit a deposition (data and metadata) to our ingest platform. Depositions will be picked up by docuteam feeder workflows, usually processing and eventually storing the information in a repository. After a successful ingest, feeder (and subsequently bridge) return PIDs for every object (file, folder) within the deposition. Using these PIDs, the client will be able to access (read and change) the deposited objects.
